LEC: 2 LeConte TWTh, 2:40–5:00pm  
Office Hours: 419 Campbell Hall,  
Mon 3–4 and Tue 5–6

G481 2008-07-30 1

## GRADES

MIDTERM grade	cutoff	N
A	45.00	17
B	40.00	16
C	35.00	16
D	30.00	9
F	0.00	7
		65

TOTAL grade	cutoff	N
A	72.00	14
B	62.10	13
C	54.60	13
D	48.00	14
F	0.00	11

G481 2008-07-30 2

## GIANT PLANET FORMATION

- in the outer solar system (B), protoplanets become massive enough to directly trap gas

- more material is available because ice is solid
- larger disk area means more material available to collect
- central star blows away gas/dust from inner regions sooner

G481 2008-07-30 3

## GIANT PLANET INTERIORS

(a) Jupiter

(b) Saturn

G481 2008-07-30 4

# GIANT PLANET INTERIORS

(c) Uranus

predominant composition

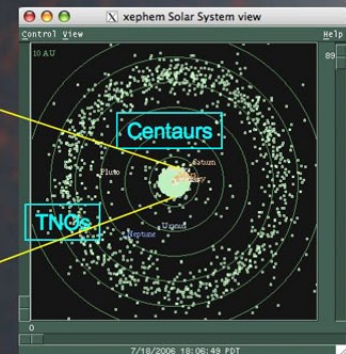

(d) Neptune

G481 2008-07-30 5

## Minor Planets

- ~338,151 minor planets known (on July 18 2006)
- Small apparent size (largest MB  $\rightarrow$  1 Ceres  $D_{app} = 0.7 \text{ arcsec} \leftrightarrow$  “seeing” limit)
- Building blocks of the Solar System linked to its formation

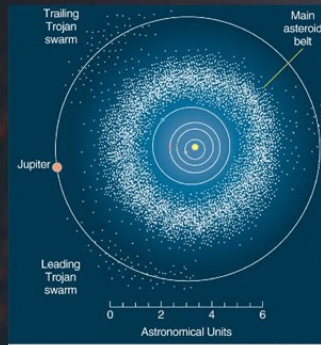

$\rightarrow$  Brief review of various populations

G481 2008-07-30 6

## Main-Belt asteroids

- Located between Mars and Jupiter
- First one (1 Ceres) was discovered in 1801
  - Larger apparent diameter (0.7" at opposition) and brighter one
  - More than ~320,000 are known today
  - Could not accrete to form a planet b/c of gravitational perturbations from Jupiter (total mass < mass of the Moon)

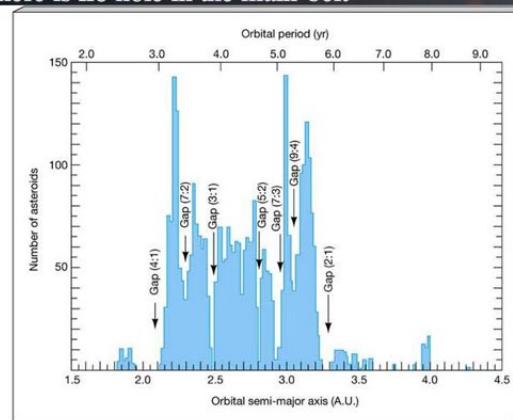

Mission planned to explore 1 Ceres and 4 Vesta called DAWN

G481 2008-07-30 7

## Orbital Resonances (again!)

Structure in the Main belt  $\rightarrow$  Kirkwood gaps

There is no hole in the main-belt

(a)

(b)

## First Close-up of Gaspra asteroid by Galileo

S-type asteroid  
20km size body  
2km size crater  
200 millions yrs old  
Cover with dust (regolith)

Harcourt, Inc. Items and derived items copyright ©2000 by Harcourt, Inc.

**243 Ida**  
S-type asteroid  
60 km size  
1By old  
More heavily cratered  
-> older  
-> reside in a denser area  
of the main belt

G481 2008-07-30 10

## Diversity of shapes and

## Asteroid types - I

- The majority are dark (Albedo = 0.03 to 0.04), with a significant fraction which brighter (Albedo = 0.15 and 0.20)
- Spectra key in identifying asteroid types
- **S-type** (17%): **stony** composition
  - Brighter since carbon is lacking
- **M-type** (few %): **metallic** composition
  - Hard to confirm these, shiny surface implies metallic surface

“Like archaeologists working to translate stone carvings left behind by ancient civilizations, the collisional and dynamical clues left behind in or derived from the Main Belt, once properly interpreted, can be used to read the history of the inner Solar System.” Bottke et al 2005

# Asteroid types - II

The dark and *primitive* asteroids (75%)

- **C-type:** Primarily made of carbonaceous materials
  - neutral black in color
- **P-type:** reddish-brown in color
- **D-type:** more strongly reddish brown in color

G481 2008-07-30 13

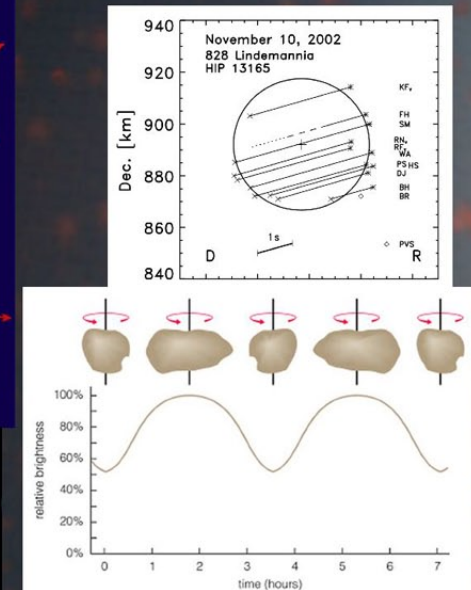

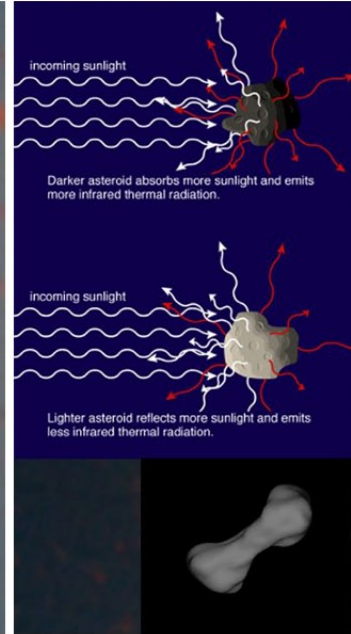

## Size and shape estimation

- From the amount of sunlight they reflect and the amount of heat they radiate. ~1000 asteroids
- By occultation of a star (observing campaign)
- Shape and rotation rate can be inferred by a study of lightcurve (photometric variation)

Ceres (940 km), Pallas (580 km), Vesta (540 km)  
 99% of asteroids with D>100km are catalogued  
 The majority have a size <a few km

G481 2008-07-30 15

# ASTEROID STRUCTURE

From E. Asphaug, 1999, "Survival of the weakest"

(a) Shape of NEA called Toutatis observed with radar

Internal structure?

- (b) Monolith
- (c) Contact Binary
- (d) Rubble Pile

The mass, and then the density, **cannot** be measured in an image. We need to derive it using Kepler 3rd law on satellites or spacecrafts

G481 2008-07-30 17

# Orbital Resonances (again!)

Trojan asteroids located in the L4 and L5 stable Lagrange points. 1:1 resonance

G481 2008-07-30 19

G481 2008-07-30 18

G481 2008-07-30 20

# SATELLITE ORIGINS

- **giant impact**
  - large event destroys impactor, two new bodies form
  - Earth/Moon
  - Pluto/Charon
- **capture**
  - large object captures smaller objects
  - Mars, Phobos, Deimos
  - Neptune, Triton
- **direct formation in a “protosatellite disk”**
  - many outer planet satellites
  - may have involved collisions between moons

G481 2008-07-30 21

G481 2008-07-30 31

## Comet orbits

### Long period comet

- Highly elliptical orbit, with an aphelion as far as 50,000 AU
- High inclination
- Both prograde and retrograde
- Reservoir: Oort cloud (up to 100,000 AU) perturbed by a passing star

### Short period comet

- Aphelion not farther than orbit of Pluto
- Prograde and close to the ecliptic
- Reservoir: Kuiper Belt (beyond orbit of Neptune) “kicked” by close encounter

G481 2008-07-30 32

G481 2008-07-30 37

# CRATERS ON WILD-2

simulated crater

G481 2008-07-30 38

# STARDUST MISSION

- sample collection and return mission
- uses aerogel to collect particles

G481 2008-07-30 39

# AEROGEL !!

- very low density
- strong
- good insulator
- captures high velocity cometary/interplanetary dust in "carrot-shaped" tracks

G481 2008-07-30 40

# COMET DUST

# COMET SHOEMAKER-LEVY/9

## ROCHE LIMIT

- limit of tidal stability
- depends on a lot of factors so no formula given here

## Comet demise

### What is the fate of a comet?

- It can impact a planet
  - Like Shoemaker-Levy 9 into Jupiter
- It can break out in pieces like LINEAR
- It can get ejected out of the solar system
- It can get put into a shorter orbit
  - Eventually “burns-out” from repeated close encounters with the solar wind near perihelion
- Impact our Sun (Sungrazer comets)

# SL9 IMPACTS

- view from approaching Galileo spacecraft

G481 2008-07-30 45

# SL9 IMPACT FLASH

- view from Earth

G481 2008-07-30 46

## Evolution of D/G Comet Impact Sites on Jupiter

Nucleus of Halley's Comet

100 km

## "CENTAURS"

- orbits lie between the orbits of the giant planets
- unstable orbits
- Centaurs thought to be KBOs whose orbits have been altered by gravitational interactions with giant planets

G481 2008-07-30 49

G481 2008-07-30 50

## PHOLUS

## SPECTRA

- Chiron is dark grey
- Pholus is very reddish

G481 2008-07-30 51

G481 2008-07-30 52

G481 2008-07-30 53

## INNER SOLAR SYSTEM

G481 2008-07-30 54

## OUTER SOLAR SYSTEM

Plot prepared by the Minor Planet Center (2008 July 30).

G481 2008-07-30 55

## KUIPER BELT OBJECTS

- some are in 3:2 orbital resonance with Neptune: "Plutinos"
- others are in stable, non-resonant orbits: classical KBOs

G481 2008-07-30 56

# KUIPER BELT OBJECT SIZES

G481 2008-07-30 57

- may extend to about 50,000 AU

The Oort Cloud (comprising many billions of comets)

Oort Cloud cutaway drawing adapted from Donald K. Yeoman's illustration (NASA, JPL)

G481 2008-07-30 66

G481 2008-07-30 67

## KBO IMAGES

- Keck telescope
- adaptive optics

G481 2008-07-30 68

Largest known trans-Neptunian objects (TNOs)

SEDNA

- 12,000 yr period
- aphelion at 975 AU
- perihelion at 76 AU
- semimajor axis 525 AU

ERIS

- artist's conception
- albedo is as high as Enceladus
- size, brightness of Sun

# PHOEBE

image from  
Cassini

# TRITON

- clouds on horizon
- surface pressure:  
15 microbars  
(1 bar =  
1 Earth  
atmosphere)

Triton • Tenuous Clouds
